Dr. Geo. Engleman

Dear Sir

Your letter

of the 25 ulth. was duly received —
Your description and facts relative to
the specimen of Marine plant sent
me are interesting to me —
I have not found the plant here to
recognize it, and yet I have an
impression that I have met with it
but supposed it a Grass —
I will look for it and if successful
will send you samples in fruit &
I have shown it to several collectors
of Algae and will do so to others,
hoping that some one of them may
be successful in finding and sending
it to you ———

I thank you for the pamphlets on botanical subjects —

I will pursue inquiries in regard to the Abies bracteata if I can obtain any information in regard to their location in the Santa Lucia Mountains The distance from here must be nearly 200 miles, but perhaps I can get the name of some botanist at Monterey or South of there from whom some information could be obtained —

I am pleased to learn that Dr. Parry make a trip was successful in his efforts to exploring the botanical treasures of a portion of Mexico — I feared the borders troubles last fall might render it unsafe for him and Dr. Palmer to venture the trip —

Yours respectfully

L. N. Dimmick
